

Python Advanced Course

List 7.

You can receive up to 6 points for this task.

There are many web services available on the web that offer API access.

Your task is to select at least two such services (different) and download any data from them. Additionally, at least one of them should use authentication, e.g. in the form of an API Key.

Program data retrieval asynchronously using `asyncio/aiohttp`.

The synchronous version, e.g. from `requests`, is worth at most 4 points.

To avoid distributing your credentials, this data (passwords, API Keys, etc.) should be placed in a separate file (e.g. `private.py`) and imported into the main solution.

On SKOS please send the implementation without the `private.py` file.

There are many sites that offer various services via some network API.

Below are two places I know of that contain information about such services:

- [RapidAPI](#)
- [public-apis](#)
