

# Python Advanced Course

## List 6.

Modify the task from the previous list so that the individual "subtasks" that perform network operations are executed in separate threads or separate processes. You can also reprogram the previous task to an asynchronous version (which I didn't have time to mention in the lecture). Check that the shared data structures are thread-safe and modify the operations on them accordingly if they are not suitable for multithreaded programs.

The task is worth 4 points.
